Sustainability in the PVC Market: Challenges and Opportunities

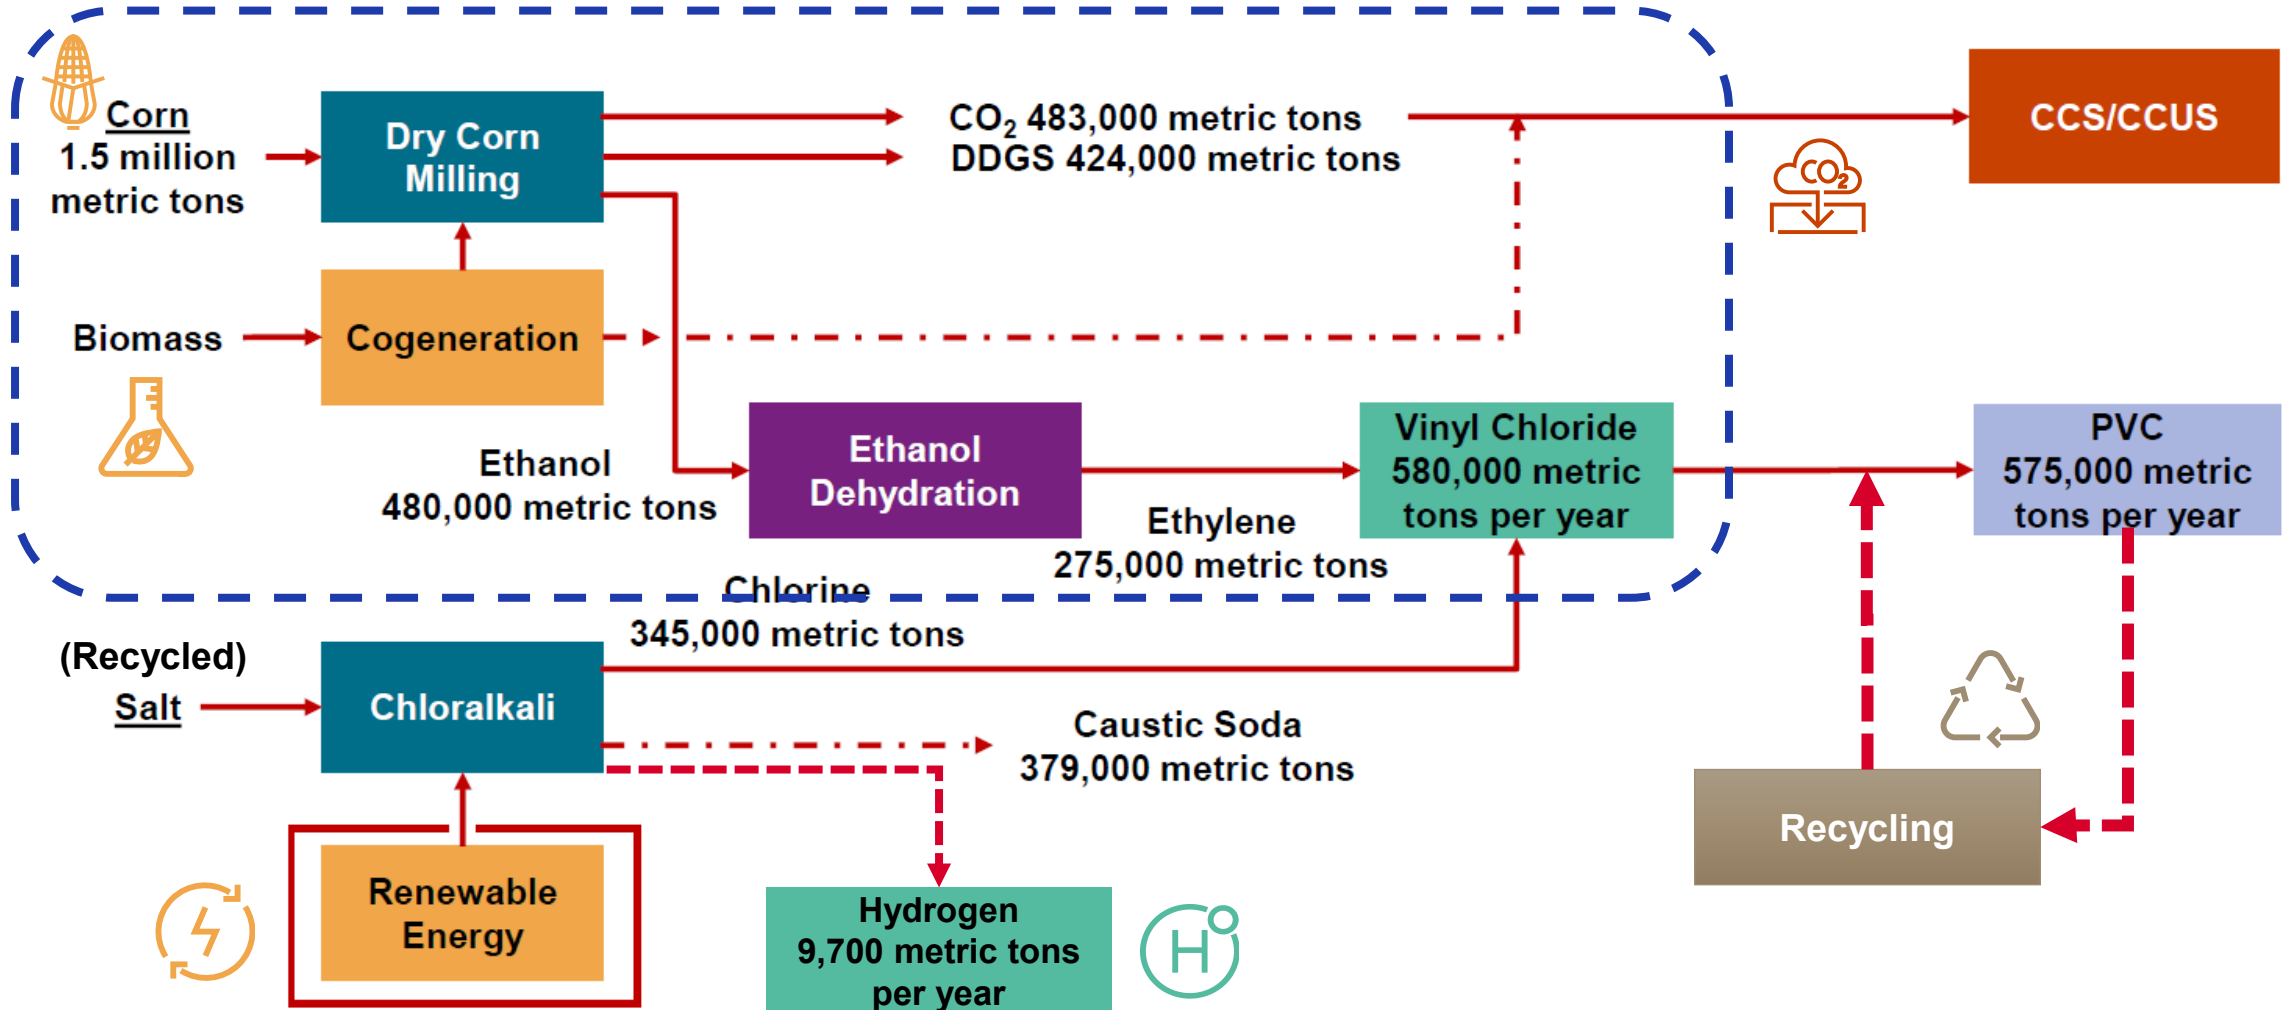

16 December 2025

The International Vinyl Sustainability Forum 2025

Alvin Ang
Director, Inorganics and Vinyls

Sustainable Chlor-alkali to PVC production involves numerous components

Implementing parts or in phases help support sustainability and receptivity towards the value chain

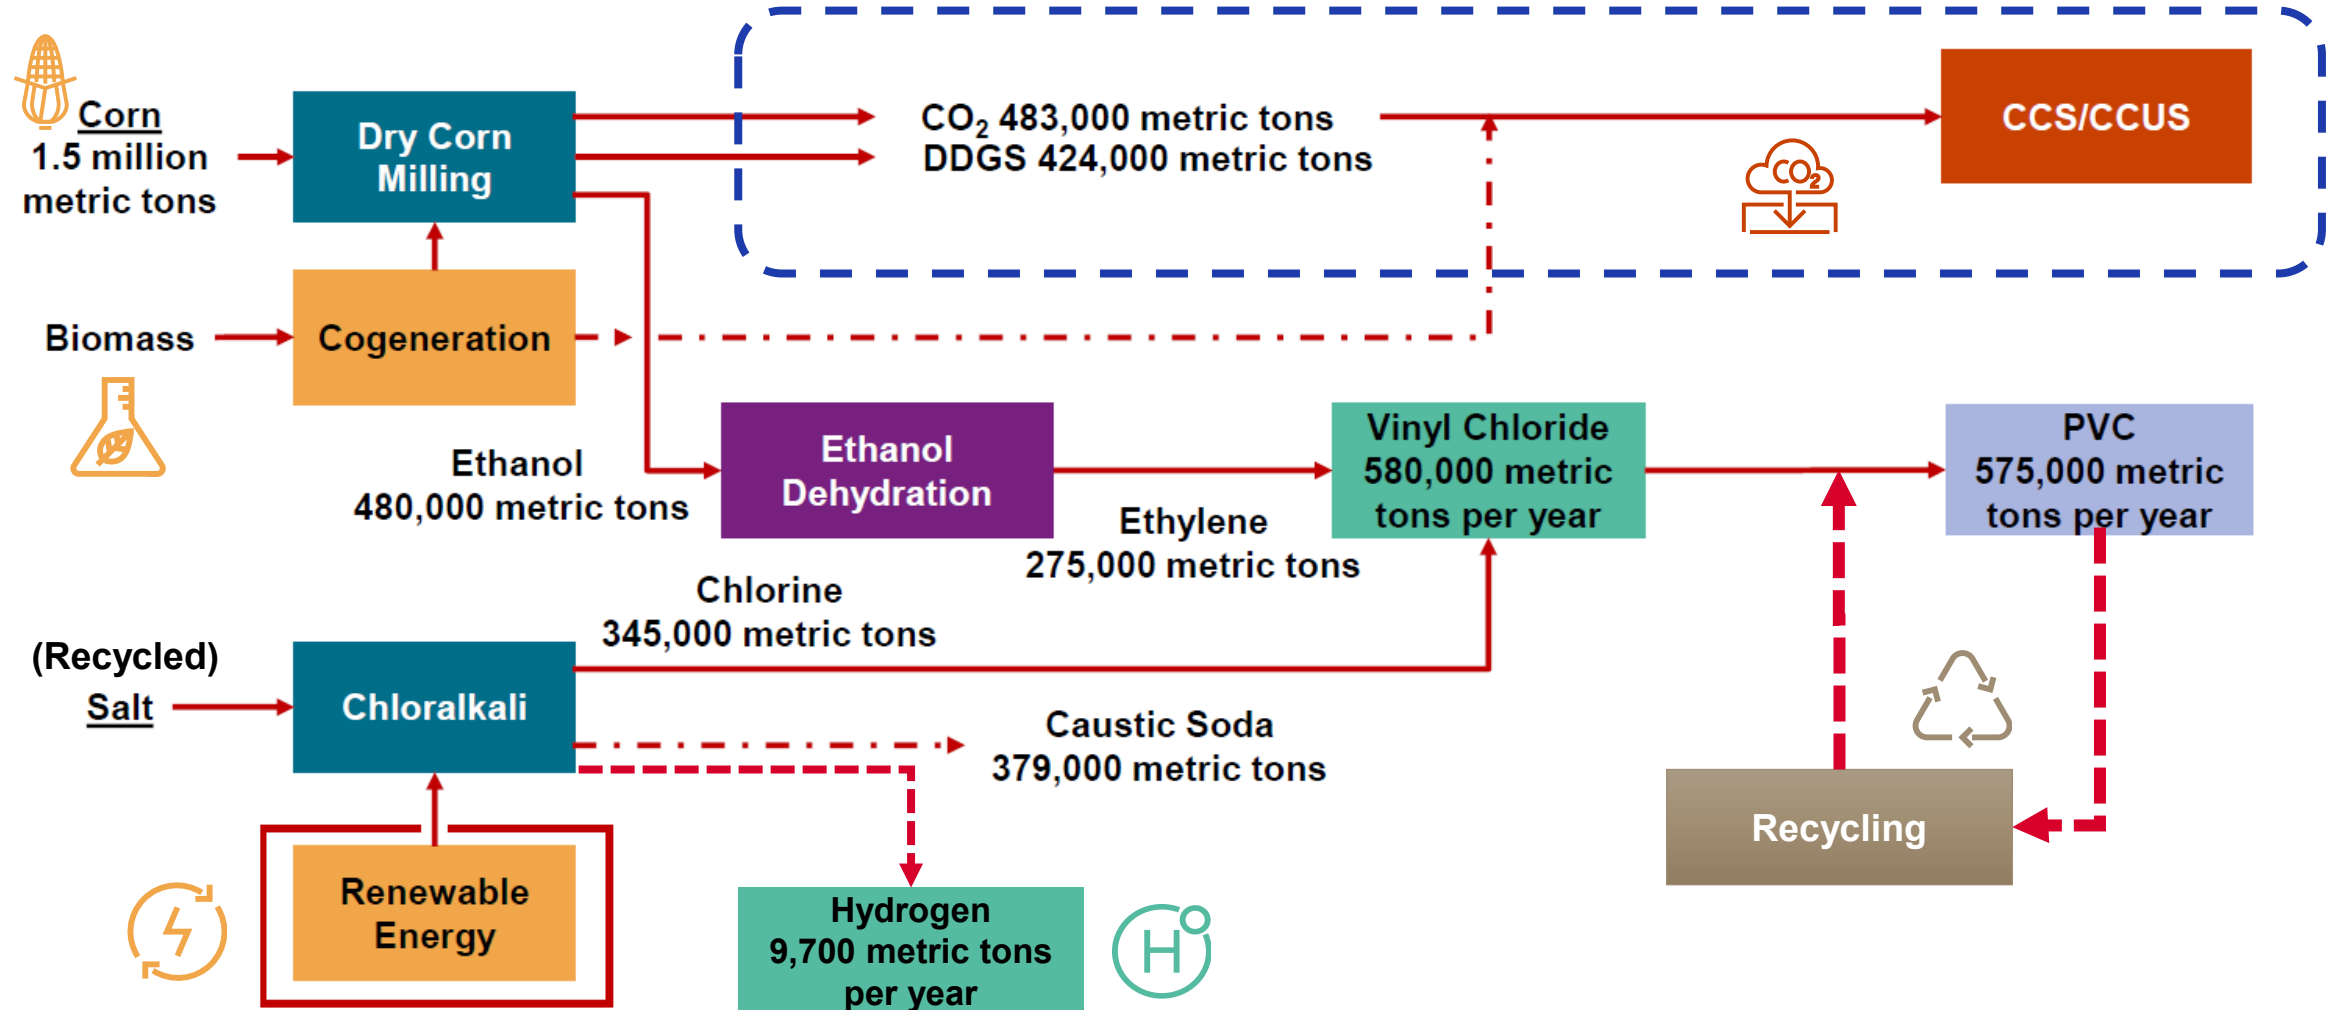

Bio-based PVC: important to consider the benefits and limitations

Benefits	
	Renewable feedstock.
	Encourage the use of 2G and 3G bio-fuels.
	Non-biodegradable: i) does not disintegrate into micro-plastics, ii) does not contaminate the recycling pool, iii) therefore, PVC made from bio-based ethylene can be recycled the same way as traditional PVC, iv) which also means the lifecycle assessment is more favorable.

Limitations	
	Suitable for plantations with high yield, e.g. adequate land and water (non-competition with food crops and protected land), intense solar radiation and climate diversification.
	Ensure efficient use of resources: e.g. converting bagasse into electricity, vinasse as fertilizer.
	Harvesting occurs during the dry season.
	Third-party auditing to ensure compliance.

China has mandated the use of waste industrial salt for new CS plants

Depending on location and conditions, it's challenging to source adequate waste salt and purify economically

On October 30, 2019, the National Development and Reform Commission (NDRC) released the "Guidance Catalogue for Industrial Structure Adjustment (2019 Edition)," which came into effect on January 1, 2020. While classifying caustic soda as restricted, the Guidance Catalogue listed ion-exchange **membrane caustic soda plants utilizing waste salt** (... among others) in the **supported** category. After the "Guidance" came into effect on February 1, 2024, the **waste salt** application was set at a minimum of **40%**.

2019年10月30日，国家发改委发布《产业结构调整指导目录（2019年本）》，自2020年1月1日起施行。指导目录在...
加：废盐综合利用的离子膜烧碱装置除外，此外...
险废物集中处理设备，“三废”综合利用与治理技术...
构调整指导目录（2019年本）》鼓励类项目。2024年2月1日《产业结构调整
指导目录（2024年本）》实施后将采用废盐应用比例明确至40%以上。

China's power fleet is already the largest in the world and will almost triple in size by 2050; coal's share will steadily decline

PVC's infrastructure advantage: riding the global water investment wave

Superior performance and enhanced green credentials fuel PVC market leadership in pipes

Infrastructure spending on water and sewer

Source: S&P Global Market Intelligence.

PVC is the leading material in large-scale water, irrigation, and sewage projects on a favorable balance of competitive upfront cost, installation ease and low failure rate.

PVC's low lifecycle carbon footprint, resource efficiency, durability, and recyclability (pipe-for-pipe) make them a preferred choice for going green.

Ongoing innovations (e.g., bio-attributed PVC, lead-free stabilizers, renewable plasticizers) will further enhance its green credentials.

Global PVC capacity expanding faster in 2025 – 2029, especially in India
